

MUST Academic Assistant

Frontend Update for Image / PDF Upload

Vision integration only - text chat integration is already complete

Purpose: the existing text agent integration should remain unchanged. The only frontend update required is to support uploading an academic-record image or PDF to the agent backend using the same session_id as the chat.

1. Backend status

The Vision parser has been integrated and tested locally with the main AI Agent backend. It is not yet deployed to the production Render service. Once the updated backend is deployed, the frontend can use the endpoint below.

2. Upload endpoint

POST /session/{session_id}/academic-record

Request type: multipart/form-data

Form field name: file

Accepted files: JPG / JPEG, PNG, PDF

Maximum file size: 10 MB

3. Critical session rule

Use the SAME session_id for the image upload and all subsequent /chat requests. The backend stores the extracted GPA, completed credit hours, major, and completed courses inside that same session. Using a different session_id creates a new session and the extracted data will not be available.

4. Frontend JavaScript example

```
const formData = new FormData();
formData.append("file", selectedFile);

const response = await fetch(
  `${AGENT_BASE_URL}/session/${sessionId}/academic-record`,
  {
    method: "POST",
    body: formData
  }
);

const data = await response.json();
```

Important: do NOT manually set the Content-Type header. The browser will generate the correct multipart/form-data boundary automatically.

5. Response contract

```
{
  "status": "processed",
  "session_id": "example_session_001",
  "extracted": {
```

```

    "gpa": 2.65,
    "completed_hours": 106,
    "major": null,
    "completed_courses": []
  },
  "profile": {
    "gpa": 2.65,
    "completed_hours": 106,
    "major": null,
    "completed_courses": []
  },
  "onboarding_complete": false,
  "extraction_status": "completed"
}

```

6. What the frontend should do after upload

If onboarding_complete is true: continue normal chat immediately.

If onboarding_complete is false: continue normal /chat flow using the same session_id; the agent will ask only for missing profile data, such as the major.

Do not send the image directly to OpenRouter, Gemini, or any Vision provider from the frontend.

Do not place any model API key in frontend code.

7. Existing text chat remains unchanged

Keep the current text-agent integration exactly as it is:

POST /chat with JSON containing session_id and question.

The only new frontend work is the multipart image/PDF upload described above.

8. Expected frontend flow

User selects image/PDF -> Frontend sends multipart/form-data -> /session/{session_id}/academic-record -> Backend Vision parser extracts academic data -> Data is saved in the session -> Frontend continues /chat with the same session_id.

Integration note: wait for confirmation that the updated Agent backend has been deployed before testing this endpoint against production.
